

## SOFTWARE ENGINEER

At HealthLoop, the code you write gets people better faster. Be developer #3 at one of the hottest health tech startups out there. We're looking for a software engineer to join the team as we expand and improve our web application, and design and build the next phase.

Here's what we're doing now:

- Support, expand and fix bugs on the existing Ruby on Rails platform
- Build new functionality to add new capabilities and workflows
- Create and consume APIs to connect with external systems

You should be something like this:

- You're a self-starter and love to figure out and own seemingly impossible problems
- You've got 4-7 years experience in building database-driven web applications
- You either know Ruby on Rails, or want to learn and are capable of learning quickly
- You care about the integrity and security of your software
- You have worked in Agile/Scrum environments
- You take responsibility for your own work, and you use your work as an opportunity to learn
- You know SQL. (Show me.)
- You have set up a home network, or a linux firewall, or you maintain a backup server, or you have shown some other "systems" aptitude and interest

Bonus points:

- You've built something where you've interacted with the public – an API, a gem, a language(!)..
- You care about your shell, editor, etc.
- You've seen Gary Bernhardt's "Wat?" talk on [destroyallsoftware.com](http://destroyallsoftware.com), and you thought it was funny

HealthLoop is angel funded. We offer competitive salary + benefits and stock options. Send a resume to [software-jobs@healthloop.com](mailto:software-jobs@healthloop.com), along with a cover letter to help us understand why you're a great fit for us. You'll be expected to show a code sample that you've written, that you're proud of.
